

Sales Performance Dashboard Report

Excel Dashboard Project Documentation

1. Objective

The objective of this dashboard is to provide management with a simple, interactive view of sales performance without requiring them to review thousands of raw sales records or multiple PivotTables. The dashboard summarizes revenue, orders, quantity sold, average order value, monthly trends, regional performance, product categories, sales channels, and top-performing products.

2. Workbook Structure

The workbook contains five worksheets: Start_Here for a quick guide; Dashboard_Plan for dashboard requirements and field mapping; Sales_Data for the raw sales dataset; Supporting_Pivots for PivotTables supporting KPIs and charts; and Sales_Dashboard for the final interactive dashboard.

3. Sales Data

Each row represents one sales order. Main fields include Order ID, Date, Region, Sales Channel, Customer Type, Product Category, Product, Salesperson, Quantity, Unit Price, Discount, and Revenue. Before building the dashboard, verify headers, date recognition, numeric fields, and consistent labels.

4. Convert Sales Data to an Excel Table

Select the complete dataset and use Insert → Table or Ctrl + T. Name the table Sales_Data. An Excel Table automatically expands when rows are added, provides structured references, and makes PivotTable maintenance easier.

5. Dashboard Requirements

The dashboard includes four KPI cards: Total Revenue, Total Orders, Quantity Sold, and Average Order Value. It also includes a monthly revenue trend, regional performance, product category performance, sales channel contribution, and Top 5 Products by Revenue.

6. Supporting PivotTables

Create supporting PivotTables on the Supporting_Pivots worksheet. Use Sum of Revenue for Total Revenue; Count of Order ID for Total Orders when each Order ID represents one order; Sum of Quantity for Quantity Sold; Date grouped by Years and Months with Sum of Revenue for monthly revenue; Region with Sum of Revenue; Product Category with Sum of Revenue; Sales Channel with Sum of Revenue; and Product with Sum of Revenue filtered to Top 5.

7. KPI Calculations

Average Order Value = Total Revenue ÷ Total Orders. For example, if revenue is \$1,250,000 and there are 8,450 orders, the average order value is approximately \$147.93.

8. Dashboard Charts

Recommended visuals are: Line Chart for Monthly Revenue Trend; Bar Chart for Regional Performance; Column or Bar Chart for Product Category Performance; Doughnut or Bar Chart for Sales Channel Contribution; and Horizontal Bar Chart for Top 5 Products by Revenue.

9. Slicers and Timeline

Add slicers for Region, Product Category, Sales Channel, and Customer Type. Add a Timeline using Date. The timeline can be used for Years, Quarters, Months, or Days. Connect the slicers and timeline to all relevant PivotTables so the dashboard responds to user selections.

10. Dashboard Layout

Place the dashboard title and updated date at the top, followed by KPI cards. Place slicers and the timeline below or beside the KPIs, then arrange the main charts in a clean grid. Keep spacing, titles, fonts, number formats, and chart formatting consistent.

11. Protection

Use Review → Protect Sheet after completing the dashboard. The purpose is to prevent accidental movement or editing of the dashboard layout while allowing users to interact with slicers and the timeline. Test all controls after protection.

12. Final Checklist

Verify that the raw data is correct; the dataset is an Excel Table; dates and numbers are recognized correctly; PivotTables and PivotCharts work; KPI calculations are correct; all charts display correctly; slicers and the timeline work; PivotTables are connected to the correct filters; formatting is consistent; and the protected dashboard remains interactive.

Dashboard Requirement Mapping

Requirement	Dashboard Element	Fields
Total Revenue	KPI Card	Revenue
Total Orders	KPI Card	Order ID
Quantity Sold	KPI Card	Quantity
Average Order Value	KPI Card	Revenue + Order ID
Monthly Revenue Trend	Line/Column Chart	Date + Revenue
Regional Performance	Bar Chart	Region + Revenue
Category Performance	Column/Bar Chart	Product Category + Revenue
Channel Contribution	Doughnut/Bar Chart	Sales Channel + Revenue
Top Products	Top 5 Bar Chart	Product + Revenue

Dashboard Flow

Sales_Data → Excel Table → Supporting PivotTables → PivotCharts → Slicers/Timeline → Sales Dashboard → Protect Sheet

This project can be used as an Excel/Data Analyst portfolio project and as an interview example demonstrating data preparation, PivotTables, dashboard design, KPI reporting, and interactive filtering.
